## South Africa - Republic of

## Citrus Semi-annual

## Strong Growth of South African Soft Citrus Exports to the United States Continues

## Approved By:

Kyle Bonsu

## Prepared By:

Wellington Sikuka

## Report Highlights:

South Africa`s production of grapefruit, oranges and lemons/limes is estimated to increase in the 2017/18 MY, based on the growth in area planted and on the normal weather conditions in the main growing regions of Limpopo, Eastern Cape and Mpumalanga. The drought conditions in the Western Cape are expected to result in a decrease in the production of tangerines/mandarins. However, duty free exports of tangerines/mandarins to the United States under the African Growth Opportunity Act (AGOA) are expected to continue their strong annual growth.

## Commodities:

Citrus, Other, Fresh
Grapefruit, Fresh
Oranges, Fresh
Tangerines/Mandarins, Fresh
Lemons, Fresh
Orange Juice

Exchange rate: Rand/US\$ Exchange $=13$
Marketing Year (MY) - January to December
MT - Metric Tons

## Executive Summary

Post estimates that the production of grapefruit will increase by 5 percent to 370,000 MT in the 2017/18 MY, due to the rise in area plated and on the normal weather conditions in the main growing regions of Limpopo and Mpumalanga. Grapefruit exports are estimated to increase by 4 percent to 240,000 MT in the 2017/18 MY, based on the increase in production, strong demand in Asia and some countries in the European Union, and the year to date exports up to April 2018.

The production of oranges is estimated to increase by 8 percent to 1.47 Million MT in the 2017/18 MY, due to normal rainfall, and an increase in area planted in the main growing regions of Limpopo, Eastern Cape and Mpumalanga, which account for about 82 percent of the total orange production. Exports of oranges are estimated to increase by 4 percent to 1.22 Million MT in the 2017/18 MY, based on the increase in production, growth in demand from China and Hong Kong, and South Africa`s successful efforts in addressing the Citrus Black Spot (CBS) challenges in the EU market.

The production of tangerines/mandarins is estimated to decrease by 2 percent to $255,000 \mathrm{MT}$ in the 2017/18 MY, mainly due to the impact of the drought which resulted in lower yields in the predominant production region of the Western Cape. The South African 2017/18 MY exports of tangerines/mandarins is estimated to increase by 5 percent to $220,000 \mathrm{MT}$, based on the industry strategy of prioritizing export markets over domestic markets and the strong demand for soft citrus in global markets.

The production of lemons/limes is estimated to increase by 7 percent to $460,000 \mathrm{MT}$ in the $2017 / 18 \mathrm{MY}$, due to the increase in area planted, new orchards coming full production, normal weather conditions in the main production areas of Eastern Cape and Limpopo, which account for about 80 percent of the production. The exports of lemons and limes is estimated to increase by 7 percent to $320,000 \mathrm{MT}$ in the 2017/18 MY, based on the increase in production and growth in demand from the Middle East and Asian markets.

## Background

Citrus in South Africa is grown across the country mainly in the Limpopo, Eastern Cape, Western Cape, Mpumalanga, Kwa Zulu Natal, Northern Cape and North West provinces. Figure 1 below shows the map of the citrus growing areas in South Africa. A total of 74,902 hectares was planted to citrus in South Africa in the $2016 / 17 \mathrm{MY}$. The Limpopo province is the largest citrus production area accounting for 43 percent of the total area planted, followed by the Eastern Cape ( 27 percent), Western Cape ( 17 percent), Mpumalanga ( 8 percent), Kwa Zulu Natal ( 2 percent), Northern Cape ( 2 percent), and North West (less than 1 percent). The Western Cape and Eastern Cape have a cooler climate, which is suited for the production of the navel oranges, lemons, limes, and mandarins/tangarines (soft citrus). The Mpumalanga, Limpopo and KwaZulu-Natal provinces have a warmer climate which is better suited to the production of grapefruit and valencia oranges.

Figure 1: Citrus Growing Areas in South Africa.

Source: Citrus Growers Association (CGA)
Figure 2 shows that while oranges are the biggest citrus type produced in South Africa and account for about 58 percent of the total citrus area planted, there has been notable growth in the area planted to soft citrus and lemons/limes.

Figure 2: Area Planted by Citrus Type

Table 1 shows the most common citrus varieties planted in South Africa. In 2016, the tango citrus variety, which was developed by the University of California Riverside, was granted the plant breeders right in South Africa and is expected to offer competition to the Nardocott variety.

Table 1: Citrus Varieties

| Citrus | Variety |
| :--- | :--- |
| Grape fruit | Star Ruby, Marsh, Rose, Flame, Nelspruit Ruby (Nelruby), Flamingo |
| Oranges | Valencias - Delta, Midknight, Turkey (Juvalle), Oukloon (Olinda, Late), Du Roi, <br> Benny. <br> Navels - Palmer, Bahianinha, Washington, Robyn, Navelina, Lane Late, Newhall, <br> Cambria, Cara Cara, Rustenburg, Autumn Gold |
| Mandarins/ <br> Tangarines | Clementine - Nules, Marisol, SRA, Oroval, Esbal, Clemenpons, Oronules. <br> Mandarin - Tango, Nadorcott (Afourer), Nova, Or (Orri), Minneola, Mor , <br> B17, Tambor , Naartjie, Thoro Temple, Sonet, B24 (African Sunset) <br> Satsuma - Miho Wase, Owari, Kuno, Miyagawa Wase, Okitsu Wase, Aoshima. |

## Grapefruit, Fresh

## Production

Post estimates that the production of grapefruit will increase by 5 percent to $370,000 \mathrm{MT}$ in the 2017/18 MY, from 354,000 MT in the $2016 / 17$ MY. This is due to the rise in area planted and on the normal weather conditions in the main growing regions of Limpopo and Mpumalanga. The increase was partially offset by hail damage in the Mpumalanga region. The 2016/17 MY production of grapefruit was revised downward based on final industry data. Limpopo is the leading growing region for grapefruit accounting for at least 59 percent of the total production, followed by Mpumalanga ( 22 percent), Kwa-Zulu Natal (10 percent), Northern Cape ( 6 percent) and the Western Cape (less than 1 percent). The predominant variety produced is the Star Ruby accounting for 84 percent of the production due to its high global demand, followed by the Marsh variety at 13 percent. Other grapefruit varieties produced in small volumes include Rose, Redheart, Pomelit, Ja Shaddock, Flame, and Fe 1(Jackson).

Figure 3 below illustrates that the area planted to grapefruit is estimated to increase by 7 percent to 7,900 ha in the $2017 / 18$ MY, from 7,393 ha in the $2016 / 17$ MY. This is due to the industry responding to the increasing global market demand and prices for grapefruit in the past two seasons.

Figure 3: Area Planted to Grapefruit

*Estimate.
Source: CGA

## Consumption

Post estimates that grapefruit consumption in South Africa will rise to 7,000 MT in the $2017 / 18$ MY, from 6,000 MT in the $2016 / 17$ MY. This is due to the increase in production, and to the growth in demand driven by the perceived health benefits or trend of grapefruit in the domestic market. The fresh
grapefruit per capita consumption in South Africa is still relatively low at below 1 kg per annum because the majority of the population has not acquired the taste for grapefruit.

## Processing

Post estimates that the grapefruit delivered for processing will increase by 8 percent to $127,000 \mathrm{MT}$ in the $2017 / 18$ MY, from 118,000 MT in the $2016 / 17 \mathrm{MY}$, based on the increase in production. The 2016/17 MY grapefruit delivered for processing was revised downwards based on the lower production and updated industry figures. Grapefruit is processed to juice, the majority of which is exported to Europe. The left-over pulp following commercial juice extraction is an important source of grapefruit oil which is used as a flavoring agent in many soft drinks. The inner peel is a source of pectin and citric acid, which are both used by the food industry to preserve fruits, jams, and marmalades. Naringin is also extracted from grapefruit peel, and gives tonic-water its distinctive bitter flavor. The grapefruit peel oil is used in scented fragrances.

## Exports

Post estimates that grapefruit exports will increase by 4 percent to 240,000 MT in the 2017/18 MY, from 230,663 MT in the $2016 / 17 \mathrm{MY}$. This is due to the increase in production, strong demand in global markets especially Asia and some countries in the European Union, and the year to date exports up to April 2018. The 2016/17 MY exports of grapefruit were slightly revised downward based on final Global Trade Atlas figures.

Although South Africa has a free trade agreement with the Europe Union which allows duty free access for its citrus exports, it continues to face challenges due to Citrus Black Spot (CBS) in the European Union (EU) market. In October 2017, South Africa suspended its exports of grapefruit to Europe in order to minimize the risks of further CBS interceptions which could have jeopardized South Africa's market access to the European Union. Industry estimates that it is costing South Africa almost R1 Billion (US\$77 Million) to address and comply with the CBS requirements in the EU market. There is also a growing emphasis to increase exports to the Middle East and Africa markets. While total volumes are still low, grapefruit exports to the United States have been growing exponentially by an average of $65 \%$ per annum in the past five years, from 76 MT in the 2012/13 MY, to 4,293 MT in the 2016/17 MY. Grapefruit exports to the United States are expected to continue growing based on the continuation of duty free access through the African Growth and Opportunity Act (AGOA).

## Imports

South Africa is not a major importer of grapefruit. Imports mainly originate from Swaziland, Spain, Turkey and Israel to fill the small demand gap towards the end of the season. The increase in local production over the past five years has resulted in a steady decline in grapefruit imports.

## Prices

Table 5 shows the local, export and processed market prices for grapefruit since the 2004/05 MY. Grapefruit prices for the export and local markets have increased over the past five years based on the weakening rand to the United States dollar. Processed prices tend to fluctuate based on supply. Export prices continue to provide the highest prices for South African grapefruit which explains` why the industry is export oriented.

Table 5: Grapefruit Prices

| MY | Local Market | Export Market | Processed |
| :---: | :---: | :---: | :---: |
|  | Average Price | Gross Price | Gross Price |
|  | Rand/ MT | Rand/ MT | Rand/ MT |

## Oranges, Fresh

## Production

The production of oranges is estimated to increase by 8 percent to 1.47 Million MT in the $2017 / 18$ MY, from about 1.36 Million MT in the $2016 / 17$ MY. This is due to normal rainfall, and an increase in area planted in the main growing regions of Limpopo, Eastern Cape and Mpumalanga, which account for about 82 percent of the total orange production. These increases were partially offset by hail damage in the Mpumalanga region and the drought conditions in the Western Cape growing region. The Western Cape accounts for about 15 percent of the total orange production, and is undergoing a severe drought. As a result, dam levels are less than 30 percent in the 2017/18 MY.

The area planted with oranges is estimated to grow marginally by about 3 percent to 44,000 hectares (ha) in the $2017 / 18$ MY, from 42,711 hectares (ha) in the $2016 / 17 \mathrm{MY}$, based on the increases in area planted to seedless orange varieties, especially in the Limpopo region. This rise was partially offset by the industry shift from orange production to soft citrus in the Western Cape. Valencia's account for about 61 percent of the total area planted to oranges, and navels account for 39 percent. Figure 4 below shows the trend in the area planted to oranges since 2007.

Figure 4: Area Planted to Oranges

[^0]Source: CGA

## Consumption

Post estimates that the 2017/18 MY consumption of oranges will increase by 1 percent to $72,000 \mathrm{MT}$, from 71,000 MT in the $2016 / 17 \mathrm{MY}$, based on the growth in production. Fresh oranges are the most popular citrus consumed in South Africa with a per capita consumption of about 1.5 kg per annum.

## Exports

The export of oranges is estimated to increase by 4 percent to 1.22 Million MT in the 2017/18 MY, from 1.17 Million MT in the 2016/17 MY, based on the increase in production, growth in demand from China and Hong Kong, and South Africa`s successful efforts in addressing the CBS challenges in the EU market. South Africa prioritizes supplying export markets, and the surplus oranges are supplied to the domestic fresh and processed markets. The EU remains South Africa's largest export market for oranges, accounting for approximately 40 percent of the total export market. However, exports to Asia and the Middle East have grown steadily over the years due to the focus being placed by industry in growing these markets. Exports to the United States are expected to continue growing based on the duty free access under the African Growth and Opportunity Act (AGOA). A gradual shift from oranges to soft citrus exports is expected, as South African farmers supplying the United States market have been switching their orchards from oranges to soft citrus in response to market preferences and the higher premium received in the United States market.

## Imports

The import of oranges is estimated to rebound to 10,000 MT in the $2017 / 18$ MY, based on imports from Swaziland that will resume following their recovery from the drought. Oranges are usually imported into South Africa in November and December to close supply gaps and satisfy year-end demand.

## Prices

Table 9 shows the local, export and processed market prices of oranges. The export market provides the highest prices. As a result, the South African citrus industry is export oriented because the domestic and processed markets offer lower prices.

Table 9: Oranges Prices

## Tangerines/Mandarins (Soft Citrus), Fresh

## Production

The production of tangerines/mandarins is estimated to decrease by 2 percent to $255,000 \mathrm{MT}$ in the 2017/18 MY, from 261,046 MT in the 2016/17 MY. This is due to the impact of the drought, which resulted in lower yields in the Western Cape, partially offset by increases in production in other growing regions such as the Eastern Cape, Limpopo and Mpumalanga. About 42 percent of tangerines/mandarins are produced in the Western Cape, followed by 31 percent in the Eastern Cape and 21 percent in Limpopo. The Western Cape is a winter rainfall region and is currently undergoing a severe drought. The below average rainfall received in 2017 and the low dam levels (about thirty percent) in the Western Cape will severely impact the availability of irrigation water in the 2017/18 MY. In the short term, farmers in the Western Cape are expected to prioritize irrigation of higher yielding varieties and orchards, while the remaining orchards would be irrigated just to keep the trees alive. There are also indications that some farmers cut down some trees to reduce costs and uprooted older orchards.

The area planted to tangerines/mandarins is estimated to increase by 2 percent to 13,500 hectares in the $2017 / 18$ MY, from $13,182 \mathrm{Ha}$ in the $2016 / 17 \mathrm{MY}$, due to growers responding to the increasing global demand for seedless tangerines/mandarins, partially offset by the impact of the drought in the Western Cape. Figure 5 shows that the area planted with tangerines/mandarins was flat from the 2006/07 MY to the 2010/11 MY. However, there has been a significant increase in area planted since the 2010/11 MY due to growers responding to the increasing global demand for seedless tangerines/mandarins and the increased investment, which was driven by high revenue as a result of the weaker rand.

Figure 5: Area Planted to Tangerines/Mandarins

*Estimate.
Source: CGA

## Consumption

The consumption of tangerines/mandarins is estimated to decrease by 7 percent to $26,000 \mathrm{MT}$ in the $2017 / 18$ MY, from 28,000 MT in the $2016 / 17 \mathrm{MY}$, due to the decrease in production and the industry strategy of prioritizing export markets.

## Exports

Despite the decrease in production, the exports of tangerines/mandarins is estimated to increase by 5 percent to 220,000 MT in the $2017 / 18$ MY, from 209,801 MT in the $2016 / 17 \mathrm{MY}$, due to the industry strategy of prioritizing export markets over domestic markets. Demand for tangerines/mandarins remains strong in the export markets. Exports to the United States under the AGOA have grown by an average of 15 percent per year over the past four seasons, from 7,443 MT in the 2013/14 MY, to 11,180 MT in the 2016/17 MY. Tangerines/mandarins are not impacted by South Africa's CBS challenges in the EU market.

## Imports

Post estimates that the 20217/18 MY imports of tangerines/mandarins will remain flat at $1,000 \mathrm{MT}$. South African tangerines/mandarins imports are only marginal in order to satisfy out of season demand.

## Lemons/Limes, Fresh

## Production

The production of lemons/limes is estimated to increase by 7 percent to 460,000 MT in the 2017/18 MY, from $430,305 \mathrm{MT}$ in the $2016 / 17 \mathrm{MY}$. This is due to the increase in area planted, new orchards coming to full production, and normal weather conditions in the main production areas of Eastern Cape and Limpopo, which account for about 80 percent of the production. These increases are forecast to be partially offset by the lower production in the drought stricken production areas in the Western Cape, which produces about ten percent of the total lemons/limes. The most popular variety of lemons planted in South Africa is the Eureka accounting for about 83 percent of the area planted, followed by Lisbon ( 9 percent), Limoneira 8A (4 percent), and Genoa (3 percent).

Figure 6 shows that the area planted with lemons/limes was initially flat from the 2006/07 MY to the 2009/10 MY. However, similar to tangerines/mandarins, the area planted increased gradually from 4,667 hectares in the $2010 / 11 \mathrm{MY}$, to an estimated 12,100 hectares in the $2017 / 18 \mathrm{MY}$, in response to growth in demand and higher prices in the export market.

Figure 6: Area Planted to Lemons/ Lime

[^1]Source: CGA

## Consumption

The domestic consumption of lemons is estimated to increase by 6 percent to 18,000 MT in the 2017/18 MY, from 17,289 MT in the $2016 / 17$ MY, based on the growth in production. Lemon juice is used as flavoring for poultry and fish dishes, and a flavor agent in cakes, tarts, biscuits, candies, ice creams and salad dressings. In the beverage industry lemons/limes are used to make lemonade, smoothies and liquors. In the cleaning industry, lemon juice is used as a degreaser and disinfectant, due to its high concentration of citric acid which can inhibit the proliferation of some molds and bacteria.

## Exports

The exports of lemons and limes is estimated to increase by 7 percent to 320,000 MT in the 2017/18 MY, from 299,260 MT in the 2016/17 MY, based on the increase in production and growth in demand from the Middle East and Asian markets. The European Union still remains the main export market for South African lemons and limes.

## Imports

Post estimates that the 2017/18 MY imports of lemons/limes will remain flat due to the available domestic production which sufficiently meets the local demand. Imports are minimal from Spain, Swaziland Brazil.

## Orange Juice

## Production

The production of orange juice is estimated to significantly increase to $30,000 \mathrm{MT}$ in the $2017 / 18 \mathrm{MY}$, from 19,367 MT in the $2016 / 17 \mathrm{MY}$. This is due to the increase in the quantity of fresh oranges delivered for processing and the higher juice extraction achieved as a result of the better quality of oranges.

Industry coordinated statistics for orange juice are largely unavailable in South Africa. The production, consumption and stock levels represent Posts` forecast based on information derived from various sources, contacts and calculations of extractions from fresh oranges delivered for processing.

## Consumption

The domestic consumption of orange juice is estimated to significantly increase to $6,000 \mathrm{MT}$ in the 2017/18 MY, from 4,600 MT in the 2016/17 MY, based on the increase in production and supply availability. The relatively high food price inflation has resulted in restricted growth in the domestic consumption of fresh fruit juices especially the one hundred percent fruit juice, and the shift in demand to orange juice concentrates.

## Export

Post estimates that the 2017/18 MY exports of orange juice will increase by 3 percent to $28,500 \mathrm{MT}$, from 27,742 MT in the $2016 / 17 \mathrm{MY}$, based on the available supply, increase in production and the year to date exports up to April 2018. The 2016/17 MY exports of orange juice were revised upwards to 27,742 MT, based on final GTA data. Post adjusted the orange juice export data to the equivalent of 65 Degrees Brix based on the respective conversion factors shown on the export tables below. Degrees Brix represents the strength of the juice based on the sugar content. Thus, 65 Degrees Brix means that the orange juice has at least 65 grams of sucrose per 100 grams of orange juice.

Producers in South Africa prefer to export fresh oranges rather than to sell to processors as export prices are eight times higher than prices achieved from processors. Netherlands, Botswana, Mozambique, Mauritius, Zambia and Zimbabwe are the biggest markets for South African orange juice exports.

## Imports

The imports of orange juice is estimated to increase significantly to $5,000 \mathrm{MT}$ in the 2017/18 MY, from 2,693 MT in the 2016/17 MY, based on the anticipated low orange juice supply in South Africa following the previous two seasons' low orange production. Zimbabwe, Brazil and Spain are the main suppliers of orange juice to South Africa. Post also adjusted the orange juice import data to the equivalent of 65 Degrees Brix based on the respective conversion factors shown on the import tables below.

## Policies and Regulations:

## United States Cold Sterilization Protocol

The Western Cape Province is the only growing region in South Africa authorized to export citrus to the United States under the cold treatment schedule to address False Codling Moth (FCM). The United States Animal Plant Health Inspection Service (APHIS) has reduced the cold treatment schedule from 24 to 22 days, which has been hugely beneficial to South Africa in terms of reducing shipping costs and in reducing fruit loss from cold damage. Exports to the United States are through the ports of Newark, Philadelphia, Houston and New Orleans.

## South African Citrus Exports from Citrus Black Spot (CBS) Areas to the United States

Currently, South Africa can only export citrus to the United States from official CBS free areas. The CBS free areas are found in the Western Cape and Northern Cape, as well as relevant districts of the Free State and North West Provinces. On August, 28, 2014, APHIS issued a notice proposing to amend the fruits and vegetables regulations to allow the import of several varieties of fresh citrus fruit, as well as Citrus hybrids, into the United States from areas in the Republic of South Africa where citrus black spot has been known to occur. The regulation would authorize imports on condition of satisfying certain systems and SPS treatment procedures. This proposal can be found on the following link; http://www.regulations.gov/\#!documentDetail;D=APHIS-2014-0015-0001. The deadline for submitting comments closed on October, 27, 2014. The final regulation is still to be finalized.

## Citrus Black Spot Challenges in the European Union Market

South Africa still faces challenges in the European Union (EU) market as a result of the stringent CBS requirements, and normally voluntarily suspends citrus exports to the EU every season to avoid any further interceptions of fruit with CBS. For example, in October 2017, South Africa voluntarily suspended citrus exports to the EU , as a precaution and risk mitigation measure to prevent a ban on citrus exports to the EU. Complying with the EU requirements for CBS costs the industry a lot of money, constrains the already limited government capacity and the scientific basis for these measures have been questioned. In addition, Argentina and Uruguay are reported to have higher CBS interceptions than South Africa. Thus South Africa considers these EU measures an unnecessary technical trade barrier. Industry estimates that the cost of complying with the EU CBS requirements is around R1 Billion (US\$77 Million) and may not be sustainable in the long run.

## South Africa Fresh Produce Importers Association

The Fresh Produce Importers Association assists members with the importation of fresh fruit and vegetables in South Africa. Information on their members, contact details and services they provide can be obtained from the following website link, http://www.fpia.co.za/contact-us/ .

## Custom Duties

United States citrus exports face a 4 percent customs duty in South Africa. Table 26 reflects the applicable custom duties when exporting citrus to South Africa

Table 26: Custom Duties Applicable to Exports to South Africa
