How to turn off apps running in background on android

Continue

Continue

Go to Settings > Apps, select an app you want to stop, then tap Force Stop.If you don't want the app to relaunch when you restart your phone, tap Uninstall to remove the app.To see what apps are running in the background, go to Settings > Developer Options > Running Services. This article explains how to stop apps from running in the background on Android 9 and higher. The Settings interface may differ depending on your phone's manufacturer and your version of Android, but the same options should be available. Here's how to kill background apps on Android: Go to Settings > Apps. Select an app you want to stop, then tap Force Stop. The app will relaunch when you restart your phone. If you want to get rid of the app permanently, select Uninstall. The app clears battery or memory issues only until you restart your phone. Any apps that launch on startup will restart and could cause the same problems. Uninstall any apps you don't use much, and this will help improve the battery or memory issues. Your Android device can run multiple apps in the background for a few reasons. Most of the time, it won't cause any battery or memory consumption problems. One factor causing your Android device's battery to drain too quickly is when there are too many apps running. You can see the apps you have running in the background by tapping the square Overview navigation icon at the lower-right corner of your Android display. Keep in mind that there may be multiple windows inside of apps, like multiple tabs inside the Google Chrome mobile browser. Each of these could potentially consume resources. There are many poorly written apps on Google Play, and when you install those on your phone, they may consume more battery power, CPU, or memory than they're supposed to. Over time, if you've installed apps that you've forgotten about, your Android memory, battery, and CPU could be burdened by the excessive load of poorly written Android background apps. The best way to alleviate the burden on your Android's system resources and extend battery life is to make sure the only apps running in the background are the ones you want running. There are a few ways to see what apps are running in the background and consuming your Android's resources. Go to Settings > System > Developer Options. If you don't see Developer Options, scroll down and select About phone, then look for Build number and tap it seven times. Tap Running Services. It shows the apps currently running on your Android, how much RAM they're consuming, and how long each has been running. To see apps consuming battery power, go to Settings > Battery > Battery Usage. As you perform these next steps, look for and consider closing any apps that: Consume excessive memory or battery power and are not optimized.You forgot about or didn't expect to see running in the background. To put your phone into battery-saving mode, go to Settings > Battery > Battery Saver and turn on the Use Battery Saver toggle. On Samsung devices, go to Device Care > Battery > Power mode and select Medium power saving or Maximum power saving. Thanks for letting us know! Get the Latest Tech News Delivered Every Day Subscribe Tell us why! The easiest way is to use the Your Phone App from Microsoft.However, this method actually runs the app from your phone and displays it on Windows rather than emulating Android on Windows. If you want to ensure your files and data are easily accessible across devices, one way is to run the same apps on your PC as you do on your Android phone. Microsoft's operating system has become increasingly Android-friendly, and we'll show you how to use this to run apps from your Android device on your Windows 10 PC. There are two main ways to run Android apps on a Windows 10 machine. You can use an Android emulator. This is an application which simulates an entire Android device (including both hardware and software), so the Android app will behave as if it's on an Android device. Emulators allow you to install the app locally, so it's always available, but they borrow a good amount of horsepower from your PC. If you feel like this is the approach for you, use the Bluestacks emulator to run Android apps on your PC. The other option is to run the app from your phone, but display and interact with it through your PC. This has the advantage of not requiring complicated emulators, but it also requires your phone be linked to your PC while you're using your apps. In this article, we're only going to cover using Microsoft's Your Phone app which allows you to interact with an Android phone via your PC. You can check out the emulation solution with the link above. These instructions require the following: A Windows PC with at least the Windows 10 May 2020 Update installed.An device running version 11.0 (or higher) of Android.In addition, Microsoft recommends having at least 8 GB of RAM. To run Android apps from your phone on Windows, take the following steps: First, get the Your Phone app from Microsoft to install on your Windows 10 PC. Make sure the version you get is at least 1.20104.15.0. Next, go to the Google Play store to get the Your Phone Companion app If you already have it installed, make sure it's updated, as you'll need at least version 1.20104.15.0 to access your apps. You'll need to link your Android device to your PC. Make sure they're on the same network, then open the Your Phone app on the PC. Click on the Get Started button. Check the I have the companion app ready option if you installed the "My Phone" app as described in step 2. Otherwise the URL on this screen will take you straight to it. Once it's installed, you can easily pair your phone by clicking the Pair with QR Code button Then, open the Link to Windows option in Android Settings, which will display a screen to confirm you are in fact seeing the QR Code. Tap Continue. Finally, point your phone at the QR Code. Once the camera picks it up, the Windows app will show a screen explaining the permissions it requires. On the phone, you can tap Allow to give Windows the permissions it needs as they come up. When you're finished tap Continue, and the two devices are linked. On the PC you'll get a welcome screen showing your phone and PC are now linked; on the Android device, you may see an additional permission as shown in the below screenshot. You'll need to accept this now, and it will also appear once each time you connect your devices. Click Start recording or casting with Your Phone Companion, which is what allows your phone to transmit its app (or entire screen) to the PC. Select the Apps option in the left-hand panel. This will display a list of apps installed on your phone. Click on the app you want, and it will launch in a window just as it looks on your device. Alternately, you can use the Open Phone Screen link to open a window which mimics your device, home screen and all. You can open and interact with apps in this way as well. When opening apps in step 13, they will open within the "phone's" window. However, when launching from the Apps screen in the Windows Your Phone app, they open in separate windows. This means you can multi-task by having multiple Android app windows open at once. You can also pin these apps to the Taskbar, just like any normal Windows app. FAQ How do I connect my Android to my Windows PC? Connect your phone and PC with a USB cable and select Transfer files on your Android. On your PC, select Open device to view files > This PC. Alternatively, connect wirelessly via Bluetooth. What is the best Android emulator? Can I run Windows on Android? Can I use Android apps on Windows 11? Thanks for letting us know! Get the Latest Tech News Delivered Every Day Subscribe Tell us why!
